General AFW Usage

Megan De Freitas - 2024-11-22 - Miscellaneous

Overview

This document covers the high level features available to the end user on all AFW products, while simultaneously covering the security and settings for SalesPad ShipCenter.

Main Page

The user is presented with the standard Windows application layout for ribbon-based applications. Across the top, there is a theme editor, the administrative dropdown menu, Application and Setup ribbon tabs, a ribbon collapse and expand control, a version number, and a help icon.

Across the bottom, there is a status (in this case, Ready) on the left, and the name of the active connection on the right (in this case, Conn).

Theme Editor

The Theme Editor is a general application feature of all SalesPad desktop products.

Clicking on either the Categories or the Themes will stylize the entire application.

Menu

Opening the administrative dropdown on the top left presents the user with available Menu options.

- Security Editor is used to manage users and user groups. It also contains pre-card security (like access) for the entire application.
- Application Settings is used to set global options, like being able to resize card headers.
- Logoff will return the user to the login wizard.
- Exit will completely exit the application.

Application Settings

This screen contains all global options for the application.

Host Service

 ${\it Chosen \ Certificate} - {\it If \ selected \ and \ } {\it Enable_SSL} \ is \ flagged \ True, \ the \ ShipCenter \ web \ service \ will be \ hosted \ using \ HTTPS.$

DNS Name - This is the domain name component of a URL. Changing this will adjust all services using the hosted web service.

Enable SSL - If set to True, the application will attempt to host the web service via HTTPS.

Host Port Number - This is the port component of a URL. By default, HTTP services are hosted on port 80 and HTTPS services are hosted on port 443. To prevent most conflicts, ShipCenter is hosted by default on port 5501 using HTTP.

Logging

Service Log Reset - Sets the number of minutes between server log refreshes if using the Server form.

Misc

Default Country Code - If set and an address is used without a country code and a country reference doesn't exist for the given country, the Default Country Code will be applied.

Show Tray Notification on Soft Exit – If set to True, closing the application using the \mathbf{X} button on the top right corner will show a notification pop-up about the application being moved to the application tray. If set to False, the application will still close to the tray, but instead of showing a notification, it will simply cease to be visible to the user.

Ribbon

Maximum Recent Items - This determines the number of recent items that are available from ribbon dropdowns.

System UI Settings

Card Header is Resizable - Setting this to True will allow end users to resize card headers as they want.

Security Editor

This screen contains application wide functionality to create, edit, and delete system users and system user groups. It also contains per-group security for the entire application.

- Carrier Setup
- Country References
- Database Update
 - \circ Can run Database Update: Setting this to False prevents users from updating the database to the latest ShipCenter tables.
- Package Setup
- Rate Comparison
- Shipment Monitor
- Shipments
- · Shipping Methods
- Shipping Sources

All ShipCenter securities are simple; either the user has access or they don't.
