How can I manage customers and their preferences in CardControl?

Cavallo Support - 2024-12-02 - FAQ

CardControl manages its own customer list, consisting of only customers for which the user has processed credit card transactions. These customers are searchable, and users can locate a customer and change preferences specifically for that customer, such as specifying that a particular customer doesn’t wish to have their credit cards stored after transactions. Users can also delete stored credit cards from a customer’s file.
