Run Script

Cavallo Support - 2026-01-15 - Setup

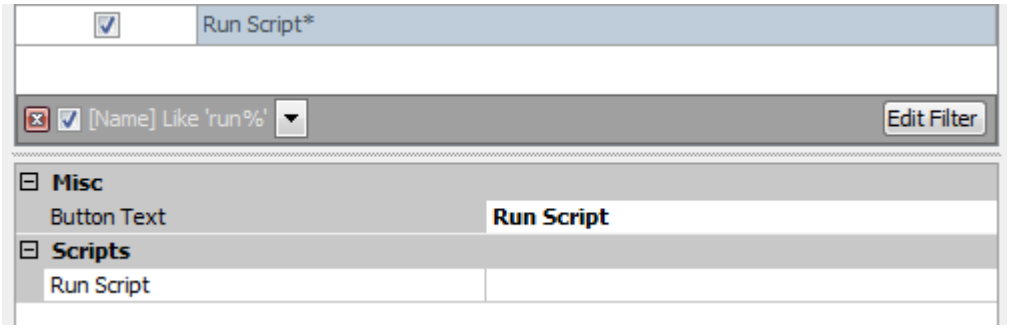

Overview

The Run Script button/plugin allows a user to execute a predetermined C# script on a sales document.

Usage

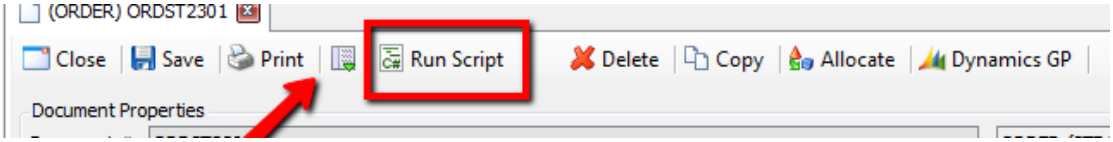

Run Script is a plugin available under the Actions dropdown on the sales document header. Enable the *Run Script* security and paste a C# script into the *Run Script* sub-setting to activate the plugin.

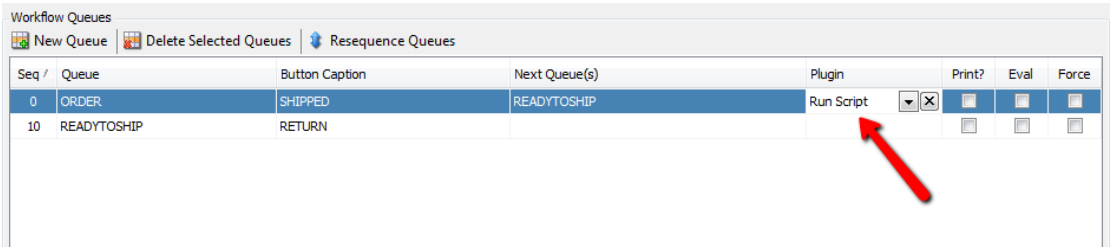

There is an additional sub-setting called *Button Text* where users can enter a different name for the Run Script function. This name will appear instead of Run Script on the plugin.

Like any other Plugin, a button for Run Script can be shown on the header, making this new plugin visually identical to the old button. Refer to the SalesPad Configure Actions and Display Plugins in the Sales Document Toolbar documentation for information on creating the button for a plugin.

Run Script can also be added to a Workflow Queue, where it will run everytime a document is forwarded through the queue:

Refer to the SalesPad Desktop: Workflow documentation for more information on setting up workflow.
