Run Script

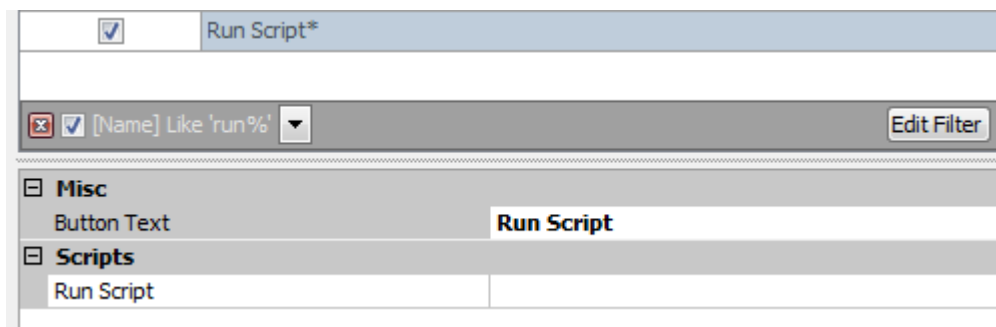

Megan De Freitas - 2025-06-25 - [Setup](#)

Overview

The Run Script button/plugin allows a user to execute a predetermined C# script on a sales document.

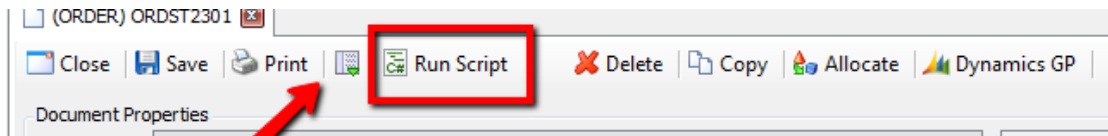

Usage

Run Script is a plugin available under the Actions dropdown  on the sales document header. Enable the *Run Script* security and paste a C# script into the *Run Script* sub-setting to activate the plugin.

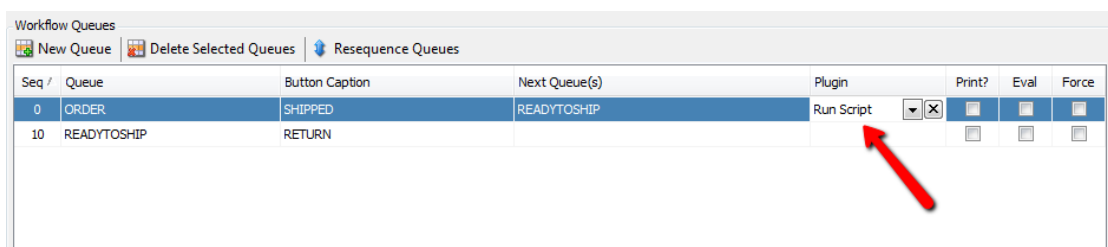

There is an additional sub-setting called *Button Text* where users can enter a different name for the Run Script function. This name will appear instead of Run Script on the plugin.

Like any other Plugin, a button for Run Script can be shown on the header, making this new plugin visually identical to the old button. Refer to the SalesPad [Configure Actions and Display Plugins in the Sales Document Toolbar](#) documentation for information on creating the button for a plugin.

Run Script can also be added to a Workflow Queue, where it will run everytime a document is forwarded through the queue:

Seq / Queue	Button Caption	Next Queue(s)	Plugin	Print?	Eval	Force
0 ORDER	SHIPPED	READYTOSHIP	Run Script	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10 READYTOSHIP	RETURN			<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Refer to the SalesPad [Desktop: Workflow](#) documentation for more information on setting up workflow.
