# Run Script

Megan De Freitas - 2024-12-03 - Setup

Overview

The Run Script button/plugin allows a user to execute a predetermined C# script on a sales document.
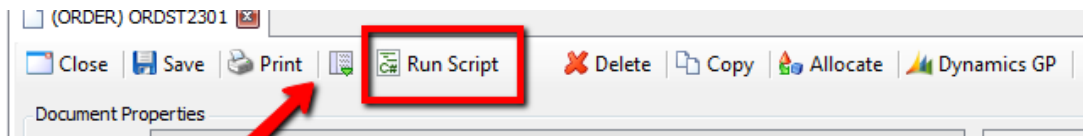

Usage

Run Script is a plugin available under the Actions dropdown 🖳) on the sales document header. Enable the *Run Script* security and paste a C# script into the *Run Script* sub-setting to activate the plugin.

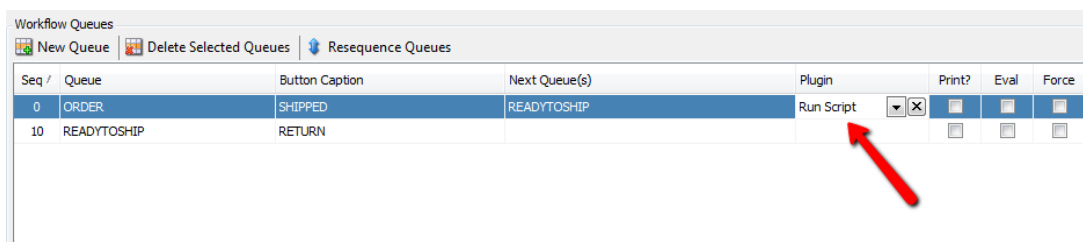

There is an additional sub-setting called *Button Text* where users can enter a different name for the Run Script function. This name will appear instead of Run Script on the plugin.

Like any other Plugin, a button for Run Script can be shown on the header, making this new plugin visually identical to the old button. Refer to the SalesPad Plugins – Configure Actions documentation for information on creating the button for a plugin.

Run Script can also be added to a Workflow Queue, where it will run everytime a document is forwarded through the queue:

Refer to the SalesPad Workflow documentation for more information on setting up workflow.
