SalesPad ShipCenter Setup

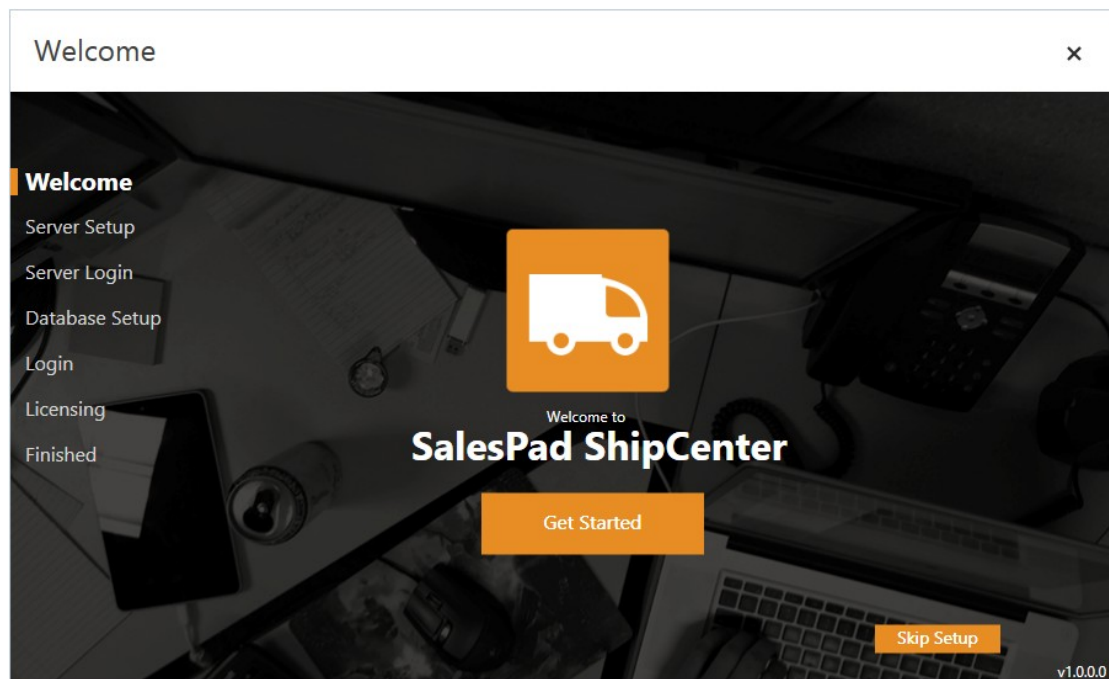

Megan De Freitas - 2024-11-22 - [Miscellaneous](#)

Overview

The ShipCenter Wizard is the first component a user sees after they've installed. It allows a user to generate the first connection and apply database updates.

Welcome

Clicking Get Started will continue through the setup phase of the Wizard. Clicking Skip Setup will move the user to the login page, where a new connection must be entered manually.

Server Setup

Server Setup is the first step in setting up a connection to Microsoft SQL Server, a comprehensive database that stores the company's information. Start by selecting the instance the user wishes to connect to.

Clicking the dropdown in the middle of the page allows the user to choose any locally running SQL Server instances that are running the SQL Server browser.

Clicking Scan for Existing Servers Again will refresh all available SQL Server instances. Use this button after turning on a SQL Browser.

If the default selection, Let SalesPad Download and Install SQL Server, is left selected, then upon clicking **Continue**, ShipCenter will attempt to download and install SQL Server. Clicking **Continue** will bring the user to the database credential page.

Server Options

SalesPad.SB requires a Microsoft SQL Server to store information. Would you like SalesPad.SB to download and Install Microsoft SQL Server for you, or would you like to select an existing SQL Server instance?

Database Setup

Database Setup sets the database name where the new ShipCenter tables will be created in the database.

The default option, Create a New Database, allows the user to create a named database to install ShipCenter to. This is the preferred methodology, as it has the greatest potential for speed.

Alternatively, clicking the dropdown in the middle of the page allows the user to select an existing database to apply the ShipCenter updates to.

Upon clicking **Login**, ShipCenter will attempt to connect to the selected instance. If successful, ShipCenter will automatically apply database updates and move the user to the Login page.

Admin User Setup

If connecting to a new database, the screen below is presented to the user for initial user creation. Additional user creation is done through the Security Editor in the main ShipCenter application.

Clicking **Continue** will move the user to the “Login” page.

The "Admin User Setup" window features a sidebar on the left with navigation links: Welcome, Server Setup, Server Login, Database Setup (highlighted), Login, Licensing, and Finished. The main content area is titled "Admin User Setup" and includes an explanatory paragraph: "We will now create the Admin user. This user will be placed in the Admin security group by default, granting the user security access to the entire application. It is from the Admin user that other users and security groups will be created initially." Below this text are three input fields: "Username:" with the value "admin", "Password:" with the value "salespad1", and "Re-Password:" with the value "salespad1". An orange "Continue" button is positioned at the bottom right of the main area.

Login

The “Login” screen is the only remnant of the setup page available after initial login. It is used to update existing connections and start up ShipCenter.

The **Connection** dropdown allows the user to change which instance and database they want to connect to.

Clicking the **+** or pencil document button next to this dropdown will open up the Connection Editor.

If you have both a trusted connection to the SQL Server instance and a user with the same name as the local user (ex. If jeffb was both the user’s login and the user’s Windows’ user name), then enabling the Trusted Credentials allows the user to not enter a password.

If all credentials are correct, clicking **Login** will attempt to start the ShipCenter main window.

The "Login" window has a sidebar on the left with navigation links: Welcome, Server Setup, Server Login, Database Setup, Login (highlighted), Licensing, and Finished. The main content area is titled "SALESPAD Login" and includes an explanatory paragraph: "Please enter your SALESPAD user credentials below to login. If you do not yet have a SALESPAD user, please contact your administrator to have an account created for you." Below this text are several input fields: a "Connection:" dropdown menu showing "Conn" with a "+" and a document icon button; a checkbox labeled "Trusted Credentials"; a "User:" field with the value "admin"; and a "Password:" field. An orange "Login" button is located at the bottom right of the main area.
