## What can the National Account plugin on the Customer Card do?

Megan De Freitas - 2024-11-22 - [FAQ](#)

When accessed from the Actions menu, parent company information will be displayed for the customer, if the open customer card is a child of a parent company. Parent/child relationships are created in Dynamics GP.

There are no specific features that support reporting, but the information could be incorporated through a quick report that filters on that information.

National Account information is stored entirely within the GP tables, so reporting can be handled entirely through Crystal or SQL Server reporting services.
