WooCommerce Integration

Product Development - 2025-07-23 - [Extended Modules](#)

Overview

Cavallo's integration with WooCommerce handles automatic syncing of inventory and sales information between SalesPad/GP and a WooCommerce website. Product and inventory level information is pushed from SalesPad/GP to the website so that customers have visibility of which products are available. Sales orders created by customers on the website are pulled down to SalesPad/GP so that they can be processed and fulfilled. Tracking information and notes for each sales order are pushed back to the website for customer visibility. Payment information can be imported from the website, and PayFabric authorizations can be imported for capturing within SalesPad. When sales orders are voided, those updates are communicated back to the website.

This document covers the configuration for all components of the WooCommerce integration.

General Information On Expressions

Overview

Many integration settings allow the use of expressions to configure how internal and external entities should be matched or to designate which values are assigned from external to internal entities.

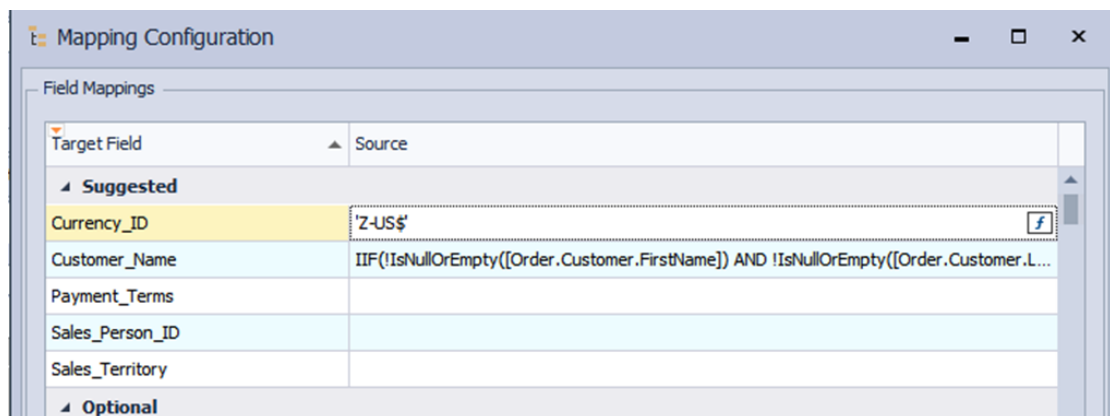

Each expression editor will have a set of source objects to match or map from, and a set of destination objects to be matched or populated. These editors allow additional complexity beyond simply mapping source object fields to destination object fields.

As an example, below is the default expression for *Customer Bill To Address Assignment Mapping - Contact_Person*. In this case, the WooCommerce order is the source object, and a SalesPad/GP CustomerAddr is the destination object. When a new SalesPad/GP CustomerAddr is created in the process of creating a customer for an imported order, this expression is used to populate the Contact_Person field.

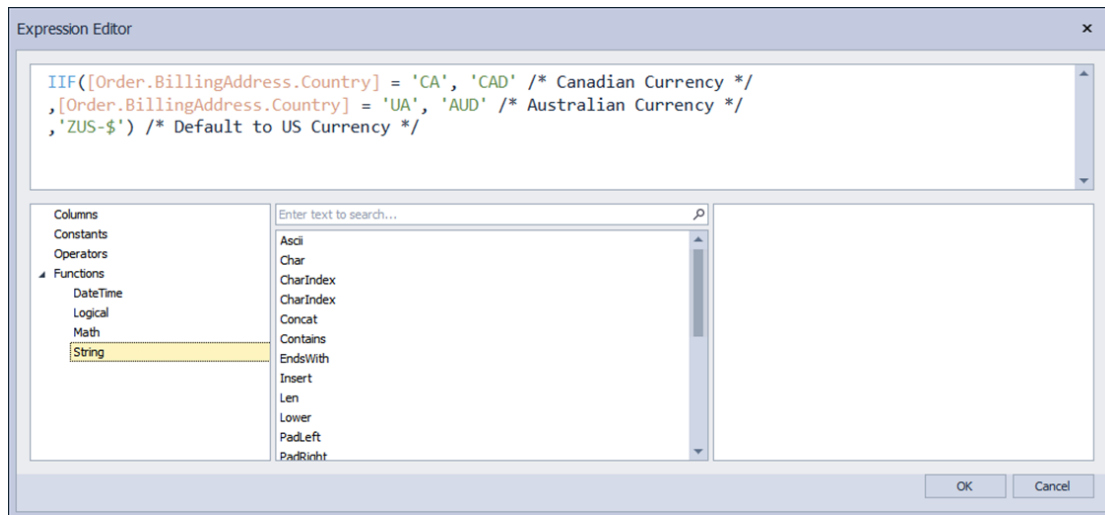

Rather than a single customer name field with the customer's full name, WooCommerce has separate first and last name fields, so the Contact Person field cannot be populated by simply mapping one field to another. The Concat function is used to append the WooCommerce Customer last name to the first name, with a space in between. If the customer's first name is "Jane" and last name is "Doe", the Contact_Person field will be "Jane Doe".

Expression editors can also be used to assign hardcoded values when populating fields. In the below example configuration of the *Customer Assignment Mapping* setting, all customers will be created with value "Z-US\$" in the Currency_ID field.

For an example of a more complex use case, the below expression includes an IIF (if statement) conditional. Comments may be included to provide notes for future reference.

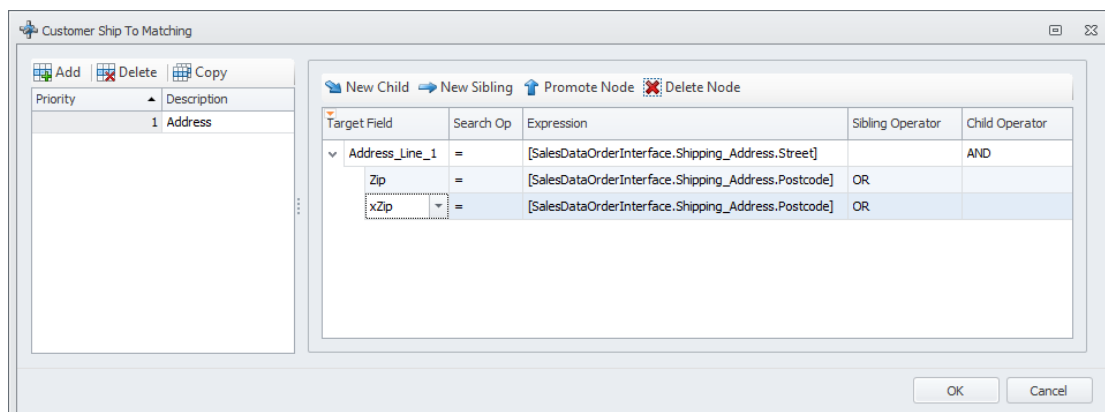

The complete expression language documentation can be found [here](#).

Sibling and Child Relationship

A combination of sibling and child expressions can be used during matching. The expressions can be joined using logical operators such as AND, OR, etc.

For example, to match the customer address on the Address Line 1 field and Zip field or xZip user field, set the Address Line 1 child operator to AND and the Zip and xZip sibling operator to OR:

Product Export

Overview

Export Item Masters from SalesPad/GP to WooCommerce. This component provides flexibility to specify which items and associated values are pushed to WooCommerce.

General Settings

Export Images During Product Export - *Disable this setting to prevent exporting images during the Product Export. This could speed up the Product Export considerably. NOTE: Images can still be exported with the Product Image Export while this setting is disabled. (Default: False)*

Number Of Products Per Export Page - *Specify the number of products in each page of*

the Product Export. (Max: 100)

Matching Settings

Product Item Master Matching - *This setting will be used to try and match every WooCommerce item to a GP Item. If a match is found, the GP Item will be used to update the WooCommerce product.*

The screenshot shows the 'Product Item Master Matching' dialog box. It has a title bar with a close button. Inside, there are two main sections. The left section contains a table with two columns: 'Priority' and 'Description'. There is one row with '1' in the Priority column and 'SKU' in the Description column. Above this table are buttons for 'Add', 'Delete', and 'Copy'. The right section contains a toolbar with buttons for 'New Child', 'New Sibling', 'Promote Node', and 'Delete Node'. Below the toolbar is a table with columns: 'Row ID', 'Target Field', 'Search Op', 'Expression', 'Sibling Operator', 'Child Operator', and 'Ignore Blank Exp...'. There is one row with '0.00' in the Row ID column, 'Item_Number' in the Target Field column, '=' in the Search Op column, and '[Product.sku]' in the Expression column. At the bottom right are 'OK' and 'Cancel' buttons.

If a product was matched to a GP item in a previous run of the Product Export, the Product Export will use that previous match instead of using the Product Item Master Matching setting. Item matches are saved to the spAAIntegratedProductLink table in the company database and can be manually adjusted or removed if needed.

Lookup Settings

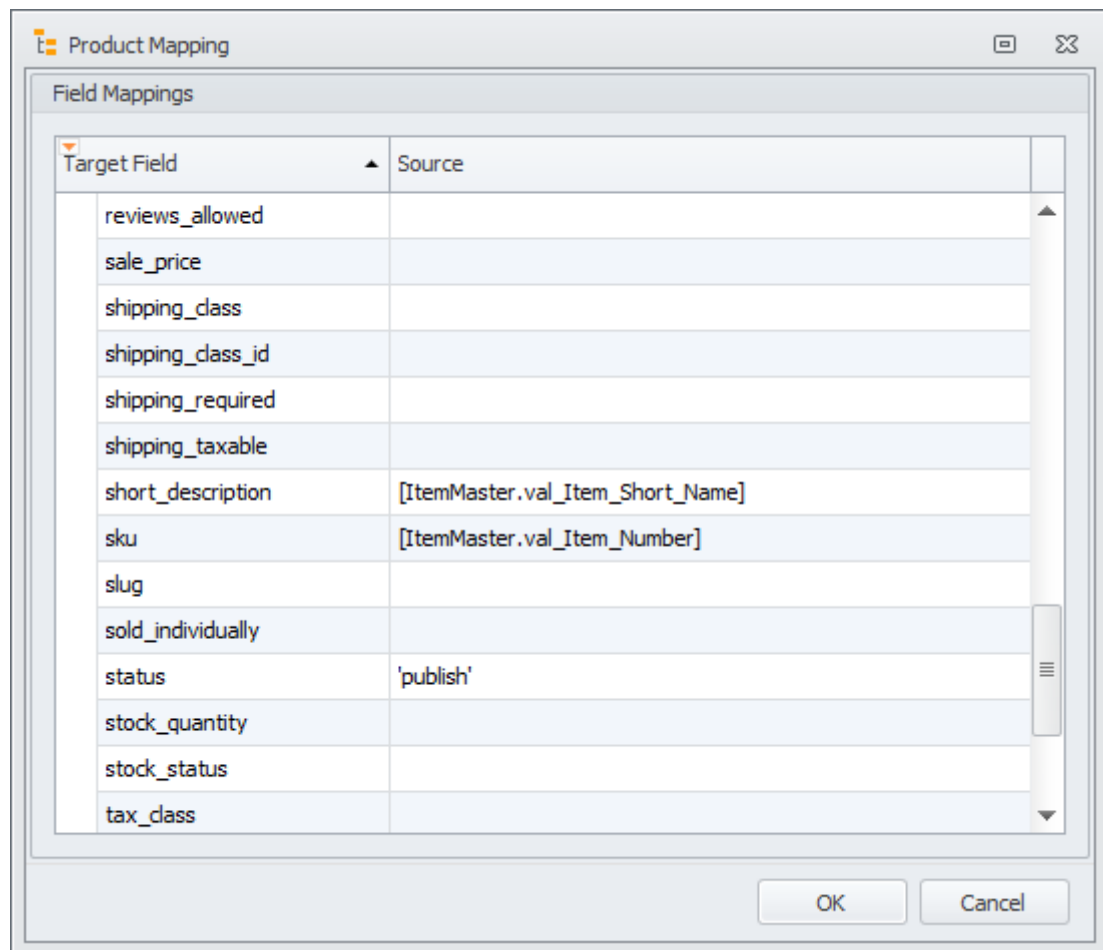

Product Export Filter - *Define the criteria for which GP Item Numbers should be exported to WooCommerce. If left blank, all active items will be exported.*

Only one priority row should be added to the left grid. The conditions on the right will be used to determine which Item Masters will be exported to WooCommerce. In the example below, the system will export all items that start with HD-.

The screenshot shows the 'Product Export Filter' dialog box. It has a title bar with a close button. Inside, there are two main sections. The left section contains a table with two columns: 'Priority' and 'Description'. There is one row with '1' in the Priority column and 'Hard Drives' in the Description column. Above this table are buttons for 'Add', 'Delete', and 'Copy'. The right section contains a toolbar with buttons for 'New Child', 'New Sibling', 'Promote Node', and 'Delete Node'. Below the toolbar is a table with columns: 'Row ID', 'Target Field', 'Search Op', 'Expression', 'Sibling Operator', 'Child Operator', and 'Ignore Blank Exp...'. There is one row with '0.00' in the Row ID column, 'Item_Number' in the Target Field column, 'LIKE' in the Search Op column, and 'HD-%' in the Expression column. At the bottom right are 'OK' and 'Cancel' buttons.

Assignment Settings

Product Mapping - *Assign the WooCommerce product fields from the GP item master.*

Processing

The Product Export bulk loads products from WooCommerce, then it updates any products that already exist in WooCommerce, and it creates new products in WooCommerce for the rest.

As of SalesPad 5.6.3, if *Export Images During Product Export* is set to True, the Product Export will also export item images to Shopify products. The *Item Image UDF* setting specifies which item master image user fields are sent to Shopify.

Endpoints

At the beginning of the Product Export, the integration bulk loads various data from WooCommerce.

List All Products

Request method: GET

Endpoint: <https://www.yourstore.com/wp-json/wc/v3/products>

See [sample response](#).

The Product Export will then update products that are already in both systems and create products that are not yet in WooCommerce.

Batch Update Products

Request method: POST

Endpoint: <https://www.yourstore.com/wp-json/wc/v3/products/batch>

See [sample request and response](#).

Scripts

Product Item Master Matching Script - *A C# Script that can be used to match a GP item based on the WooCommerce product. This runs after an evaluation has been made with the Product Item Master Matching setting.*

Product Pre Export Script - *A C# Script that runs before a Product is exported.*

Product Post Export Script - *A C# script that runs after a product is successfully exported.*

Product Image Export

Overview

The Product Image Export exports SalesPad item images to their corresponding WooCommerce products by uploading them as WordPress media. This component is an alternative to configuring the Product Export to export product images via the *Export Images During Product Export* setting. Images can take longer to sync than other item data, so it can be helpful to separate that processing so that the Product Export can run faster and more often. This component also offers script hooks that are specific to the image export process.

This component is available as of SalesPad 5.6.3.

General Settings

WordPress Application Password User - *The WordPress user to whom the WordPress Application Password belongs.*

WordPress Application Password - *An Application Password for WordPress. This integration currently only uses WordPress's REST API for uploading product images. Go to Users -> All Users -> select a user -> Application Passwords -> Add Application Password to generate a password. Then enter the generated password (not the name) into this setting and the selected user into the WordPress Application Password User setting.*

Maximum Image Height And Width In Pixels - *Images that have a height or width in pixels greater than this setting's value will be resized to be smaller than this setting's value. If set to 0, images will not be resized. NOTE: This setting applies to both the Product Export and the Product Image Export. (Default: 0)*

Matching Settings

If a product was matched to a GP item via the Product Export, the Product Image Export will use that previous match instead of using the Product Item Master Matching setting. Item matches are saved to the spAAIntegratedProductLink table in the company database and can be manually adjusted or removed if needed.

Assignment Settings

Item Image UDF - *Set the Item Master UDFs that contain the product images to send to WooCommerce. NOTE: This setting applies to both the Product Export and the Product Image Export.*

Processing

The Product Image Export component uploads images to WordPress as media if they don't already exist. It then assigns the media to products.

Endpoints

Media New

Request method: POST

Endpoint: <https://www.yourstore.com/wp-json/wp/v2/media/new>

See [sample request and response](#).

NOTE: This is a WordPress API endpoint.

Batch Update Products

Request method: POST

Endpoint: <https://www.yourstore.com/wp-json/wc/v3/products/batch>

See [sample request and response](#).

Scripts

Product Image Pre Export Script - A C# script that runs before a product image is exported. NOTE: This setting only applies to the Product Image Export.

Product Image Post Export Script - A C# script that runs after a product image is successfully exported. NOTE: This setting only applies to the Product Image Export.

Inventory Level Export

Overview

This automation component allows sending specific SalesPad/GP inventory quantities to the WooCommerce store. WooCommerce does not have a concept for multiple warehouses, so it is recommended to total up the quantities for each item across all applicable warehouses.

General Settings

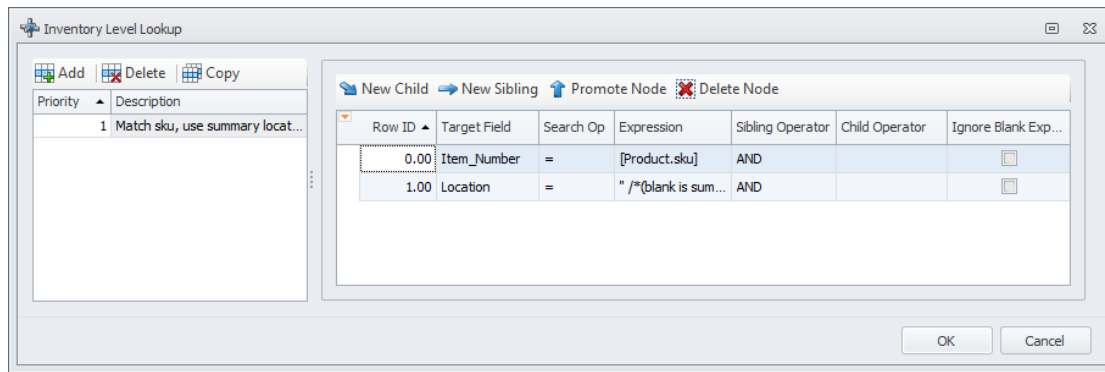

Log WooCommerce Inventory Levels Not Updated - *The integration pulls all WooCommerce items, then attempts to find a GP item based on the Inventory Level Lookup setting. Set this value to true if you would like a log for each WooCommerce item that could not be matched. Defaults to false.*

Number Of Records Per Export Page - *Specify the number of records in each page of the Inventory Level Export. (Max: 100) Defaults to 10.*

Inventory Level Export Location - *The GP location to use when exporting inventory quantities to WooCommerce. If left blank, the Inventory Level Export will export each item's total quantity across all locations (a.k.a. the summary warehouse's quantities).*

Matching Settings

Inventory Level Lookup - *Define which GP Inventory Quantity Master record should be used to update the Product Inventory Levels. This should be used to match both Item and Location. If left blank, no inventory level quantity will be exported. Only one GP Site will be used per WooCommerce product, regardless of whether the filter returns multiple GP locations.*

The **Inventory Level Lookup** dialog box contains a left sidebar with 'Add', 'Delete', and 'Copy' icons, and a 'Priority' dropdown set to '1'. The main area has a toolbar with 'New Child', 'New Sibling', 'Promote Node', and 'Delete Node' icons. Below the toolbar is a table with the following data:

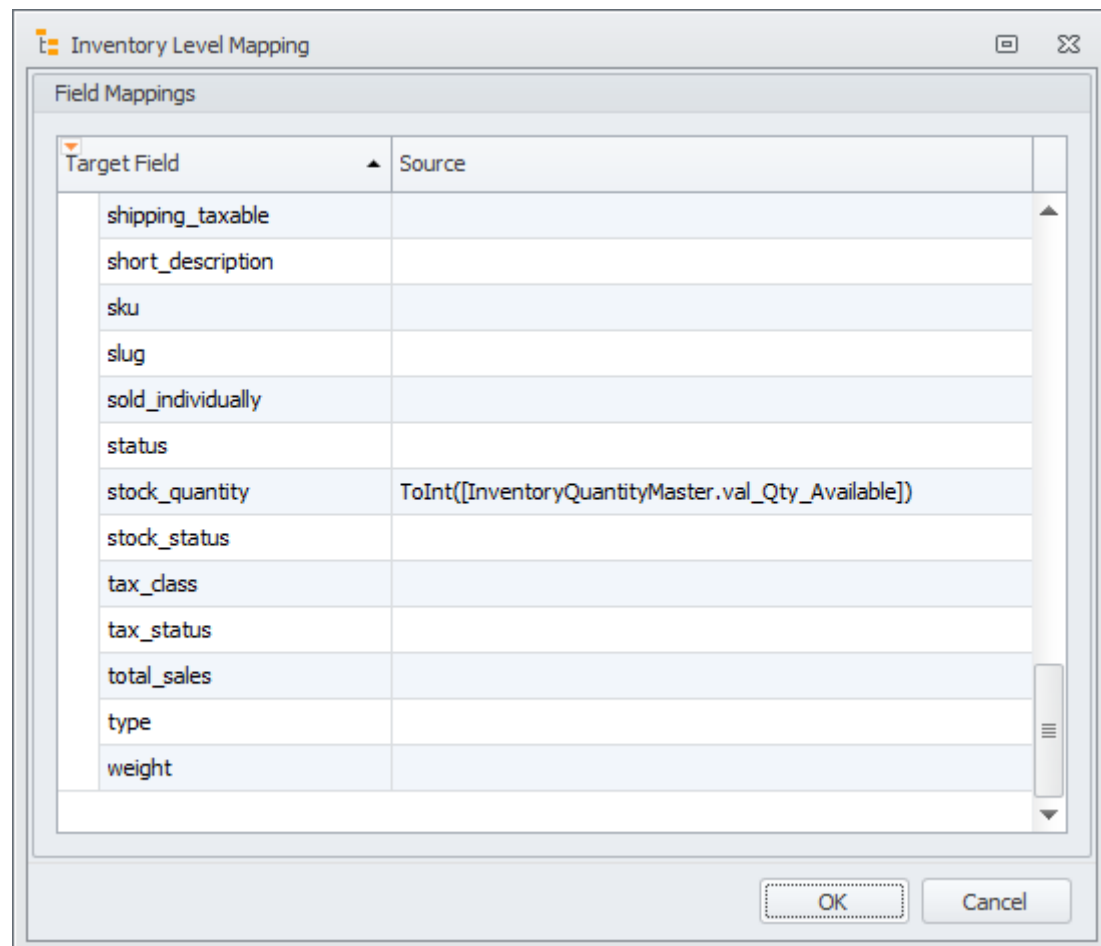

Row ID	Target Field	Search Op	Expression	Sibling Operator	Child Operator	Ignore Blank Exp...
0.00	Item_Number	=	[Product.sku]	AND		<input type="checkbox"/>
1.00	Location	=	" /*(blank is sum...	AND		<input type="checkbox"/>

At the bottom right are 'OK' and 'Cancel' buttons.

The export uses the Product Item Master Matching setting to match products to GP items and the new Inventory Level Export Location setting to determine which location to use. If a product was matched to a GP item via the Product Export, then the Inventory Level Export will use that previous match instead of using the Product Item Master Matching setting. Item matches are saved to the spAAIntegratedProductLink table in the company database and can be manually adjusted or removed if needed.

Assignment Settings

Inventory Level Mapping - Assign the WooCommerce Stock quantity from the GP Inventory Location defined in Inventory Level Matching.

The **Inventory Level Mapping** dialog box features a 'Field Mappings' section with a table. The table has two columns: 'Target Field' and 'Source'.

Target Field	Source
shipping_taxable	
short_description	
sku	
slug	
sold_individually	
status	
stock_quantity	ToInt([InventoryQuantityMaster.val_Qty_Available])
stock_status	
tax_class	
tax_status	
total_sales	
type	
weight	

At the bottom right are 'OK' and 'Cancel' buttons.

Processing

The Inventory Level Export bulk loads inventory levels and products from WooCommerce, and then it updates the inventory levels in WooCommerce.

Endpoints

At the beginning of the Inventory Level Export, the integration bulk loads data from WooCommerce.

List All Products

Request method: GET

Endpoint: <https://www.yourstore.com/wp-json/wc/v3/products>

See [sample response](#).

The Inventory Level Export will then update inventory levels for products that are in both systems.

Batch Update Products

Request method: POST

Endpoint: <https://www.yourstore.com/wp-json/wc/v3/products/batch>

See [sample request and response](#).

Scripts

Inventory Level Pre Export Script - *A C# Script that runs before an Inventory Level is exported.*

Inventory Level Post Export Script - *A C# Script that runs after a batch of Inventory Levels is successfully exported.*

Customer and Order Import

Overview

For each sales order on the website, the Order Import component will attempt to match a SalesPad/GP Customer to the WooCommerce Customer based on the *Customer Ship To Matching*, *Customer Bill To Matching*, and *Customer Matching settings*. If no match is found, a new customer will be created in SalesPad/GP based on the *Customer Assignment Matching setting*, and address codes for the new customer will be determined by the *Customer Ship To Assignment Mapping* and *Customer Bill To Assignment Mapping* settings.

Once the customer and addresses are matched or created, the sales order will be created based on the *Sales Document Assignment Mapping*, *Item Master Matching*, and *Sales Line Assignment Mapping* settings.

Payment information can be imported for sales orders as general or PayFabric payments. PayFabric transactions are created based on the *Sales Document PayFabric Mapping* setting.

General Settings

Enable Order Import Trace - *If enabled, customer and customer address matching information will be logged during order import. This setting should be enabled for troubleshooting purposes only. Defaults to False.*

Flag Comment For Imported Order - *Create a comment to send to a WooCommerce order when the document is imported. Defaults to "This order was imported into SalesPad."*

Forward Document After Import - *If enabled, the imported order will be forwarded in workflow after being saved. Defaults to False.*

Import Orders In Status - *Select the Order Status that should be imported from WooCommerce. Defaults to "processing".*

Multiple Potential Customers Scenario - Review Queue - *Queue that contains orders where a definitive customer match couldn't be found due to multiple possibilities being present. By default, the order will use the customer that has the earliest created date, then the order will be moved to the Workflow Queue designated by this setting to be reviewed.*

Named Notes Tab for WooCommerce Order Comments - *Specify which tab to import WooCommerce order comments to on the Sales Document. Defaults to "Internal Notes".*

Number Of Days To Look Back - *Specify the number of days to look back from today to import orders. For example, set to 30 to import orders only from the last 30 days. Set to zero to import orders from any time. Defaults to 0.*

Number Of Orders Per Page - *Specify the number of orders to import at one time. Defaults to 50.*

Roll Back Order Import Transaction On Error - *When enabled, the transaction encompassing the order import will be rolled back when an error occurs. This prevents data from a partially completed import from being saved to the database. Defaults to True.*

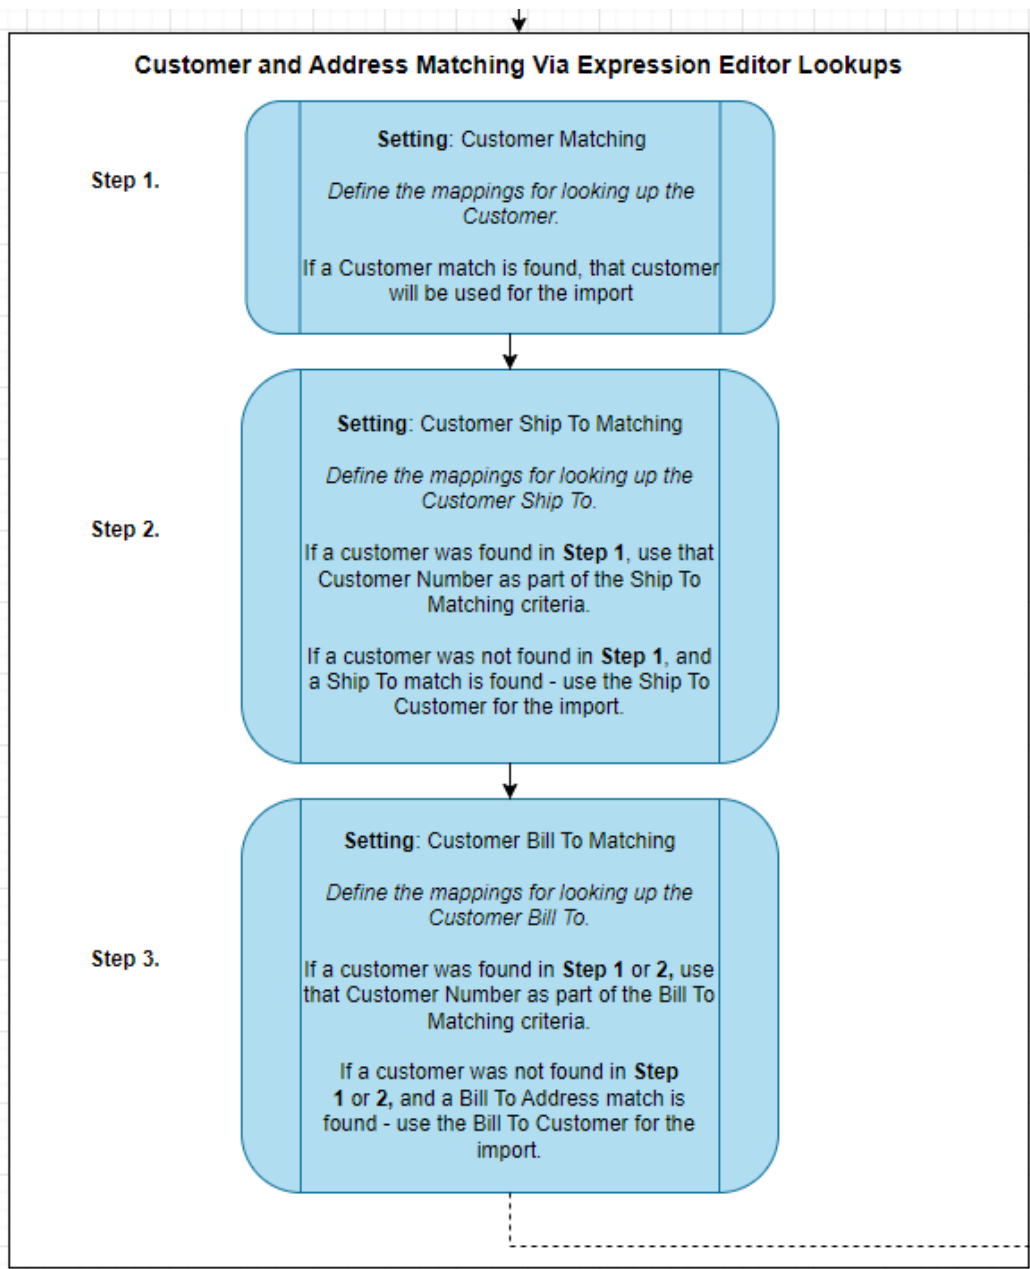

Update WooCommerce Order Status After Import - *After an order is imported into SalesPad, update the Order Status in WooCommerce. Defaults to "completed".*

Matching Settings

These settings use Expression Editors that allow creating custom matching criteria to determine how a WooCommerce entity should match a SalesPad/GP entity.

Each Matching setting will build one or more SQL queries to attempt to find a match in the SalesPad/GP database. These queries are executed one at a time in order of Priority (lowest to highest). If an earlier priority query returns a result, that result will be returned to be used in the import, and the subsequent priorities will not execute.

The diagram below illustrates the sequence in which SalesPad attempts to match a SalesPad/GP Customer, Ship To Address, and Bill To Address each time a WooCommerce Order is imported.

Customer Matching - *Define the mappings for looking up the Customer.*

This setting is used as the first attempt to match a SalesPad/GP Customer to a WooCommerce Customer. If a customer is found in this step, that customer's Customer Number will be added to the search criteria when looking up the Ship To and Bill To Addresses.

Note that this setting does not need to be populated, since the customer can also be matched indirectly via Customer Ship To Matching or Customer Bill To Matching settings. If WooCommerce Orders should be matched by the shipping address instead, then the *Customer Matching* setting can be cleared, and the *Customer Ship To Matching* and/or *Customer Bill To Matching* settings will be used to load the Ship To / Bill To and the corresponding customer.

If an order's WooCommerce customer was matched to a GP customer in a previous run of the Order Import, then the new order will use that previously matched GP customer instead of using the Customer Matching setting. Customer matches are saved to the

spAAIntegratedCustomerLink table in the company database and can be manually adjusted or removed if needed.

Customer Ship To Matching - *Define the mappings for looking up the Customer Ship To Address.*

This setting determines how SalesPad will attempt to look up the Ship To Address for an incoming WooCommerce order. If a SalesPad/GP Customer was matched via the Customer Matching setting, the Ship To Address must also belong to that customer. Otherwise, the search will consider address codes across all customers.

For example, if the customer 'AARONFIT0001' has already been matched, only address codes having a Customer_Num of 'AARONFIT0001' will be considered, even if they otherwise match the criteria in the Ship To Address Matching setting. If a customer has not yet been matched when a Shipping Address is found, the order will be imported under the customer for that shipping address.

The default settings attempt to match a SalesPad/GP Shipping Address in three different steps.

Priority 1

Address: Attempt to find a match based on Address Line 1, City, State, and Zip. All four of these fields must be matched.

The screenshot shows the 'Customer Ship To Matching' dialog box. On the left, a list of priorities is shown: 1 Address, 2 Contact, and 3 Primary Address. The 'Address' priority is selected. The main area displays a table with four rows, each representing a field to be matched:

Row ID	Target Field	Search Op	Expression	Sibling Op...	Child Oper...	Ignore Blank...
0.00	Address_Line_1	=	[Order.shipping.address_1]	AND		<input type="checkbox"/>
1.00	City	=	[Order.shipping.city]	AND		<input type="checkbox"/>
2.00	State	=	[Order.shipping.state]	AND		<input type="checkbox"/>
3.00	Zip	=	[Order.shipping.postcode]	AND		<input type="checkbox"/>

Priority 2

Contact: Attempt to find a match based on the First and Last Name of the WooCommerce Customer or WooCommerce Shipping Address.

The screenshot shows the 'Customer Ship To Matching' dialog box. On the left, the 'Contact' priority is selected. The main area displays a table with one row, representing a field to be matched:

Row ID	Target Field	Search Op	Expression	Sibling O...	Child Oper...	Ignore Blank...
0.00	Contact_Person	=	Concat([Order.shipping.first_n...			<input type="checkbox"/>

Priority 3

Primary Address: Attempt to find a match based on the Primary Address for the Customer.

This assumes that the Customer was matched via the *Customer Matching* setting.

Row ID	Target Field	Search Op	Expression	Sibling Op...	Child Op...	Ignore Blan...
0.00	Customer_Num	=	[Customer.val_Customer_Num]	AND		<input type="checkbox"/>
1.00	Address_Code	=	[Customer.val_Primary_Ship...]	AND		<input type="checkbox"/>

Customer Bill To Matching - Define the mappings for looking up the Customer Bill To Address.

This setting determines how SalesPad Desktop will attempt to look up the Bill To Address for an incoming WooCommerce order. If a SalesPad/GP Customer was matched via the Customer Matching setting, the Bill To Address must also belong to that customer. Otherwise, the search will consider address codes across all customers.

For example, if the customer 'AARONFIT0001' has already been matched, only address codes having a Customer_Num of 'AARONFIT0001' will be considered, even if they otherwise match the criteria in the Bill To Address Matching setting. If a customer has not yet been matched when a Bill To Address is found, the order will be imported under the customer for that shipping address.

The default settings attempt to match a SalesPad/GP Billing Address in three different steps.

Priority 1

Address: Attempt to find a match based on Address Line 1, City, State, and Zip. All four of these fields must be matched.

Row ID	Target Field	Search Op	Expression	Sibling Op...	Child Op...	Ignore Blan...
0.00	Address_Line_1	=	[Order.billing.address_1]	AND		<input type="checkbox"/>
1.00	City	=	[Order.billing.city]	AND		<input type="checkbox"/>
3.00	State	=	[Order.billing.state]	AND		<input type="checkbox"/>
4.00	Zip	=	[Order.billing.postcode]	AND		<input type="checkbox"/>

Priority 2

Contact Person: Attempt to find a match based on the First and Last Name of the WooCommerce Customer or WooCommerce Shipping Address.

Customer Bill To Matching

Add Delete Copy

Priority Description

1	Address
2	Contact
3	Primary Address

New Child New Sibling Promote Node Delete Node

Row ID	Target Field	Search Op	Expression	Sibling Op...	Child Op...	Ignore Blan...
0.00	Contact_Person	=	Concat([Order.billing.first_n...			<input type="checkbox"/>

OK Cancel

Priority 3

Primary Address: Attempt to find a match based on the Primary Address for the Customer. This assumes that the Customer was matched via the *Customer Matching* setting.

Customer Bill To Matching

Add Delete Copy

Priority Description

1	Address
2	Contact
3	Primary Address

New Child New Sibling Promote Node Delete Node

Row ID	Target Field	Search Op	Expression	Sibling Op...	Child Op...	Ignore Blan...
0.00	Customer_Num	=	[Customer.val_Customer_N...	AND		<input type="checkbox"/>
1.00	Address_Code	=	[Customer.val_Primary_Bill_...	AND		<input type="checkbox"/>

OK Cancel

Item Master Matching - *Define the mappings for matching WooCommerce items to a GP Item Master.*

Each WooCommerce Line Item will use this setting to find the corresponding SalesPad/GP Item.

The default settings attempt to match a WooCommerce SKU directly to a SalesPad/GP Item Number.

Item Master Matching

Add Delete Copy

Priority Description

1	Sku
---	-----

New Child New Sibling Promote Node Delete Node

Row ID	Target Field	Search Op	Expression	Sibling Op...	Child Op...	Ignore Blan...
0.00	Item_Number	=	[OrderLineItem.sku]			<input type="checkbox"/>

OK Cancel

If a WooCommerce line item was matched to a GP item via the Product Export, the Order Import will use that previous match instead of using the Item Master Matching setting. Item matches are saved to the spAAIntegratedProductLink table in the company database and can be manually adjusted or removed if needed.

Assignment Settings

Assignment settings use Expression Editors to define how newly created Customers,

Orders, and Sales Lines will be populated when created during the order import process.

The target objects will be SalesPad/GP Customers, Contacts, Sales Documents, and Sales Line Items. The source objects will be WooCommerce Orders and Order Line Items.

Complete WooCommerce API documentation can be found [here](#).

Each Mapping contains a grid of all the target fields and an expression that will be used to populate each field. Required fields are grouped under the Suggested category. If a Suggested category field is not populated, an error may occur.

Customer Assignment Mapping - Define the mappings to be used when creating a new Customer.

If an existing SalesPad/GP Customer was not found using the matching settings, then a new Customer will be created using the values in the *Customer Assignment Mapping* setting.

Processing

The Order Import retrieves all orders in WooCommerce that are ready to be imported, and then it creates customers and addresses as needed before creating the sales orders. It adds a comment and updates the status of the order in WooCommerce to indicate that importing was completed.

Endpoints

List All Orders

Scripts

Sales Document Pre Import Script - A C# Script that runs before a Sales Document is imported.

Parameters: System.ComponentModel.CancelEventArgs ce, Object sourceDoc, SalesPad.Bus.SalesDocument sd

When importing a WooCommerce Order, this script runs before any assignments have been executed. This script can be used to cancel the import early by setting `ce.Cancel = true`. Note that Sales Document fields populated by this script may be overridden by assignment settings.

New Customer Creation Script - A C# Script that runs after a new customer is created and before it is saved.

Parameters: System.ComponentModel.CancelEventArgs ce, Object sourceDoc, SalesPad.Bus.SalesDocument sd, SalesPad.Bus.Customer customer

This script will run before a new customer is saved for the first time. The script runs after the assignments from the *Customer Assignment Mapping*, but before the assignments from the *Customer Ship To Assignment Mapping* and the *Customer Bill To Assignment Mapping*.

The script can be used to do more complex assignments, and it can cancel the import by setting `ce.Cancel = true`.

Customer And Address Matching Script - A C# Script that runs after the customer and addresses have been matched, and can be used to load a different customer, ship to address, or bill to address.

Parameters: System.ComponentModel.CancelEventArgs ce, Object sourceDoc, SalesPad.Bus.Customer customer, SalesPad.Bus.CustomerAddr shipToAddr, SalesPad.Bus.CustomerAddr billToAddr, bool multipleCustomersFound

This script will run after the customer and addresses have been matched. It can be used to do more complex assignments or additional validation, and it can cancel the import by setting `ce.Cancel = true`.

Sales Document Pre Save - A C# Script that runs just before a Sales Document is saved.

Parameters: System.ComponentModel.CancelEventArgs ce, Object sourceDoc, SalesPad.Bus.SalesDocument sd

After this script runs, the new sales document is saved. This script is the last opportunity to adjust values, or cancel the import by setting `ce.Cancel = true`.

Sales Document Payment Script - A C# Script that can be used to override the default payment mappings. (Setting: Sales Document Payment Mapping)

Parameters: System.ComponentModel.CancelEventArgs ce, Object sourceDoc, SalesPad.Bus.SalesDocument sd

This script can override the default payment mappings, and it can cancel the import by setting `ce.Cancel = true`.

Item Master Matching Script - A C# Script that can be used to load SalesPad.Bus.ItemMaster item.

Parameters: System.ComponentModel.CancelEventArgs ce, Object sourceDoc, Object sourceLine, SalesPad.Bus.SalesDocument sd, SalesPad.Bus.ItemMaster item

This script can override the default matched Item Master, and it can cancel the import by setting ce.Cancel = true.

Customer and Customer Address Tracing

Depending on the complexity of the matching configuration, it may be difficult to tell how each customer and customer address is getting matched during order import. Order Import Tracing functionality will log every possible matching result to the spAAIntegrationTrace table in the database, regardless if the matching was successful or not. Tracing may be enabled by enabling the *Enable Order Import Trace* setting under Order Import. Note that enabling this setting may cause database bloat, so it is intended only for troubleshooting purposes.

The following quick report can be used to query the spAAIntegrationTrace table in SalesPad:

```
<report name="AA Integration Trace" AutoLinks="true" GroupFooterShowMode="Expanded" bestFitAll="true" AutoFit="false">
```

```
<description />
```

```
<query addWhere="true">SELECT *
```

```
FROM (
```

```
SELECT Automation_Name = ai.Instance_Name
```

```
,Automation_Description = ai.Instance_Description
```

```
,Component_Name = aic.Component_Name
```

```
,Trace_Name = ait.Trace_Name
```

```
,Group_ID = ait.Group_ID
```

```
,External_Object_Key = ait.External_Object_Key
```

```
,External_Object = ait.External_Object
```

```
,Mapping_Info = ait.Mapping_Info
```

```
,Business_Object_Name = ait.Business_Object_Name
```

```
,Search_Clause = ait.Search_Clause
```

```
,Results = ait.Results
```

```
,Created_On = ait.Created_On
```

```
,Created_By = ait.Created_By
```

```
FROM spAAIntegrationTrace AS ait WITH (NOLOCK)
```

```
LEFT JOIN spAAInstance AS ai WITH (NOLOCK) ON ai.AA_Instance_ID = ait.AA_Instance_ID
```

```
LEFT JOIN spAAInstanceComponent AS aic WITH (NOLOCK) ON aic.AA_Instance_ID = ait.AA_Instance_ID
```

```

AND aic.Component_ID = ait.AA_Component_ID

) AS a</query>

<search name="Automation Name" column="Automation_Name" searchOp="LIKE" Type="Text"
/>

<search name="Trace Name" column="Trace_Name" searchOp="LIKE" Type="Text" />

<search name="External Object Key" column="External_Object_Key" searchOp="LIKE"
Type="Text" />

<search name="Business Object Name" column="Business_Object_Name" searchOp="LIKE"
Type="Text" />

<search name="Created On" column="Created_On" searchOp="=" Type="DateTime" />

<OnRunScript />

</report>

```

The embedded SQL query can be used directly from SSMS.

Order Export

Overview

The Order Export component creates orders in WooCommerce based on SalesPad sales orders. It exports open SalesPad orders which are in specific workflow queues, creates each corresponding website order based on configurable mapping settings, and then it forwards the SalesPad orders in workflow once processing is complete.

This component is available as of SalesPad 5.6.4.

General Settings

Export Orders In Workflow Queue - *Specify the workflow queues that will be processed to export documents to the website.*

Order Export Failure Queue - *In the event of an unsuccessful export, the document will be placed into this queue.*

Flag Comment For Exported Order - *Create a comment to send to a WooCommerce order when the document is created from SalesPad.*

Multiple Potential Customers Review Queue - *Queue where a sales document will be sent when a definitive customer match could not be found due to multiple possibilities being present. Possible website customers will be audited for review.*

Line Custom Attribute Name - *The name of the line item custom attribute which contains the linked sales line item's Line Num. This attribute is required for the Order Export to be able to write External IDs to each sales line item after creating the order. Beginning the attribute's name with an underscore (_) signals to WooCommerce to hide the attribute on the WooCommerce portal order page.*

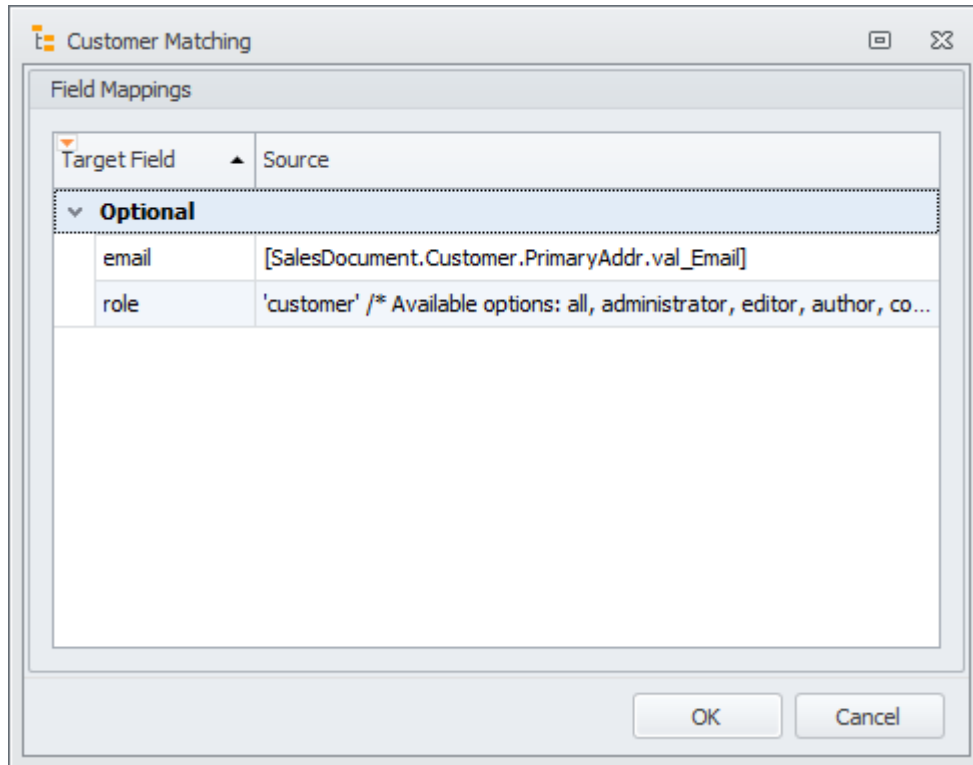

Validate Taxes After Export - *When enabled, SalesPad will validate taxes between the exported sales document and the newly created WooCommerce order.*

Add Freight As Fee Line - *If set to true, the sales document freight amount will be added as a fee line instead of a shipping line.*

Number Of Sales Documents Per Page - *The Order Export, Order Update Export, Order Invoiced Export, and Order Voided Export components use paged loading to load sales documents from the GP database. This setting specifies the number of sales documents per page. (Default: 50)*

Matching Settings

Customer Matching - Define the mappings for finding the website customer based on the SalesPad customer. This matching setting is only used if the entities are not already linked via the spAAIntegratedEntityLink table.

The image shows a 'Customer Matching' dialog box with a 'Field Mappings' section. It contains a table with two columns: 'Target Field' and 'Source'. There is a section labeled 'Optional' with a dropdown arrow. Below it, there are two rows of mappings: one for 'email' mapped to '[SalesDocument.Customer.PrimaryAddr.val_Email]' and one for 'role' mapped to ''customer' /* Available options: all, administrator, editor, author, co...'. At the bottom right are 'OK' and 'Cancel' buttons.

Target Field	Source
Optional	
email	[SalesDocument.Customer.PrimaryAddr.val_Email]
role	'customer' /* Available options: all, administrator, editor, author, co...

Assignment Settings

Sales Document Assignment Mapping - Define the mappings to be used when creating a new sales document on the website.

Sales Line Assignment Mapping - Define the mappings to be used when creating a new sales line on the website.

Bill To Assignment Mapping - Define the mappings to be used when creating a billing address for a new order on the website.

Ship To Assignment Mapping - Define the mappings to be used when creating a shipping address for a new order on the website.

Misc Charge Assignment Mapping - Define the mappings to be used when creating a misc. charge fee line for a new order on the website.

Discount Assignment Mapping - Define the mappings to be used when creating a discount fee line for a new order on the website.

Freight Assignment Mapping (Fee Line) - Define the mappings to be used when creating a freight fee line for a new order on the website.

Freight Assignment Mapping (Shipping Line) - Define the mappings to be used when creating a shipping line for a new order on the website.

Processing

For each sales document in GP, the Order Export component attempts to match a SalesPad/GP customer with the corresponding WooCommerce customer based on the Customer Matching setting. If no match is found, that order will not be exported to the website. If a customer match is found, the order is created in WooCommerce for that customer.

Order billing and shipping addresses are populated from the sales document billing and shipping addresses using the Bill To Assignment Mapping and Ship To Assignment Mapping settings. Order properties, including

the payment information, are populated using the Sales Document Assignment Mapping setting.

Order line items are populated using the Sales Line Assignment Mapping setting. This setting acts as both a mapping and matching setting. If a link does not exist in the spAAIntegratedProductLink table, this setting will be used to match the GP item to the corresponding WooCommerce product. WooCommerce order line items can be created from (in order of precedence): product SKU, variation ID, and product ID.

Order fee lines are added for sales document misc. charge and discount amounts using the Misc Charge Assignment Mapping and Discount Assignment Mapping settings respectively. By default, freight is added as a shipping line using the Freight Assignment Mapping (Shipping Line) setting, but it can be added as a fee line instead by enabling the Add Freight As Fee Line setting.

The Order Pre Export Script is executed before the post order request is sent to WooCommerce. The script can be used to modify the order request or cancel the export. The Order Post Export Script is executed after the order has been posted in WooCommerce.

If the Validate Taxes After Export setting is enabled, SalesPad will audit any tax discrepancies between SalesPad and WooCommerce and send the sales document to the review batch.

NOTE: WooCommerce calculates taxes independently of SalesPad/GP. Tax information will need to be imported into WooCommerce for taxes to be calculated correctly. Please see the [WooCommerce tax configuration documentation](#) for more information.

Endpoints

Retrieve An Order

Scripts

Order Pre Export Script - A C# script that runs before the sales document is exported.

Order Post Export Script - A C# script that runs after the sales document is exported.

Order Update Export

Overview

The Order Update Export component is used to export tracking numbers and notes back to WooCommerce for orders that were originally created by the Order Import component.

This component will target a designated workflow queue. Each document in that queue will use the link that was created during the order import to call the WooCommerce API and update the appropriate document. For Sales Documents, the External ID designates the linked WooCommerce Order ID. The Sales Line Item also includes an External ID column that stores the ID of the corresponding WooCommerce line item.

General Settings

Export Queue - Queue that contains orders ready to be exported to WooCommerce. This component will ignore orders which do not have an External ID, but will assume that any orders which have an External ID belong to the linked WooCommerce website even if the order originated from a different automation instance.

Orders that were imported from WooCommerce will need to be directed into this queue so that they can export tracking information back to WooCommerce. They will wait to be processed, and afterward, they will be forwarded in the workflow.

Export Failure Queue - In the event of an unsuccessful export, the document will be placed into this queue.

If there is an exception during the order export process, the document will be moved to this queue and the error will be logged to the Automation Agent Action Center.

Roll Back Order Update Export Transaction On Error - When enabled, the transaction encompassing the Order Update Export will be rolled back when an error occurs. This prevents data from a partially completed export from being saved to the database. Defaults to True.

Tracking Update Notify - Notify customer of tracking update. Defaults to True.

Processing

The Order Update Export gets each order from WooCommerce, and then it adds a note with the item and tracking information.

Order note example:

The following items have shipped via tracking numbers 0123456789, 5555555555, 9898989898, 3336669999, 4444488888:

Item Number 'A100' (Qty: 1)

Item Number 'CAP100' (Qty: 5)

Item Number '100XLG' (Qty: 3)

Item Number 'HD-40' (Qty: 1)

Endpoints

List All Orders

Request method: GET

Endpoint: <https://www.yourstore.com/wp-json/wc/v3/orders>

See [sample response](#).

Create Order Note

Request method: POST

Endpoint: <https://www.yourstore.com/wp-json/wc/v3/orders/<id>/notes>

See [sample request and response](#).

Scripts

Order Update Export Pre Submission Script - *A C# Script that will execute prior to sending tracking info to WooCommerce.*

Order Invoiced Export

Overview

The Order Invoiced Export component is used to export sales line invoiced quantities to WooCommerce. It can also notify the customer of the invoiced item quantities.

This component is available as of SalesPad 5.6.2.

General Settings

Invoice Export Queue - *Queue that contains invoices ready to be exported to WooCommerce. This component will ignore invoices that do not have an External ID, but will assume that any invoices that have an External ID belong to the linked WooCommerce store even if the corresponding order originated from a different automation instance.*

Invoice Export Failure Queue - *In the event of an unsuccessful export, the document will be placed into this queue.*

Invoice Notify - *Notify customer of invoice update. (Default: False)*

Processing

The Order Invoiced Export retrieves each order from WooCommerce and adds a note with the quantity invoiced for each sales line item.

Order note example:

The following items have been invoiced:

Item 'A100' (Qty: 1)

Item 'CAP100' (Qty: 1)

Item '100XLG' (Qty: 1)

Endpoints

Create Order Note

Request method: POST

Endpoint: <https://www.yourstore.com/wp-json/wc/v3/orders/<id>/notes>

See [sample request and response](#).

Scripts

Order Invoiced Export Pre Submission Script - *A C# Script that will execute before invoicing an order in WooCommerce.*

Order Voided Export

Overview

The Order Voided Export component is used to cancel WooCommerce orders.

General Settings

Cancellation Notify - *Notify Customer of order cancellation. Defaults to True.*

Number Of Days To Look Back - *Specify the number of days to look back from today to export voided orders. For example, set to 30 to export voided orders only from the last 30 days. Set to zero to export voided orders from any time. Defaults to 30.*

Processing

The Order Voided Export component loads sales orders from SalesPad/GP and then voids corresponding orders in WooCommerce by updating the order status and note.

Order status is set to cancelled:

```
order.status = WooCommerce.Utils.OrderStatus.cancelled;
```

Order note example:

```
This order was voided in SalesPad.
```

Endpoints

Retrieve Order
